

Telecom Churn Case Study

BY: Abhigyan Das , Arjun TB and Atish Dhondge

Problem Statement

- In the telecom industry, customers are able to choose from multiple service providers and actively switch from one operator to another. In this highly competitive market, the telecommunications industry experiences an average of 15-25% annual churn rate. Given the fact that it costs 5-10 times more to acquire a new customer than to retain an existing one, **customer retention** has now become even more important than customer acquisition.

GOAL FOR THE CASE STUDY

There are quite a few goals for this case study:

- For many incumbent operators, *retaining high profitable customers is the number one business goal.*
- To reduce customer churn, telecom companies need to **predict which customers are at high risk of churn.**

Definitions of churn

There are various ways to define churn, such as:

Revenue-based churn: Customers who have not utilised any revenue-generating facilities such as mobile internet, outgoing calls, SMS etc. over a given period of time. One could also use aggregate metrics such as 'customers who have generated less than INR 4 per month in total/average/median revenue.

The main shortcoming of this definition is that there are customers who only receive calls/SMSes from their wage-earning counterparts, i.e. they don't generate revenue but use the services. For example, many users in rural areas only receive calls from their wage-earning siblings in urban areas.

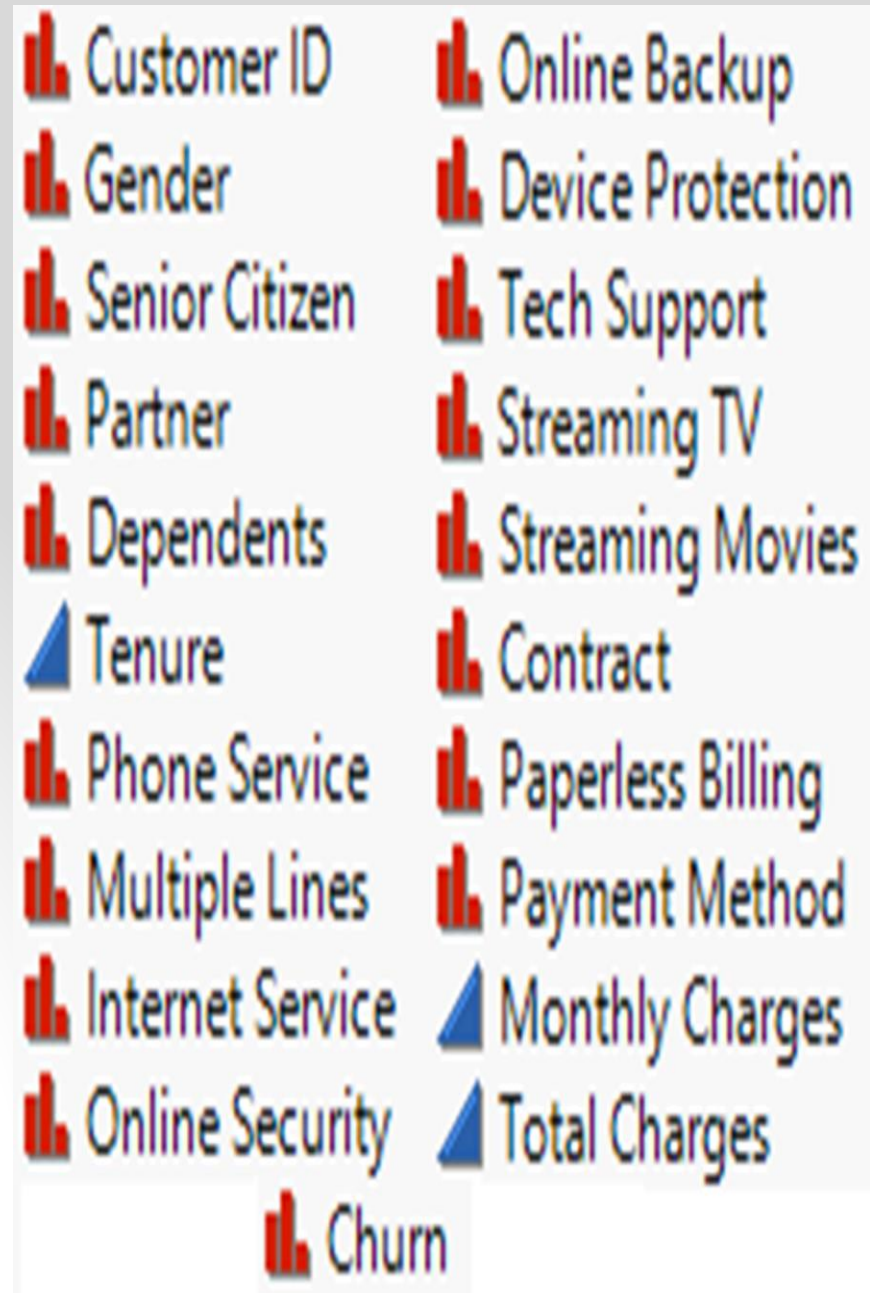

Usage-based churn: Customers who have not done any usage, either incoming or outgoing - in terms of calls, internet etc. over a period of time.

A potential shortcoming of this definition is that when the customer has stopped using the services for a while, it may be too late to take any corrective actions to retain them. For e.g., if you define churn based on a 'two-months zero usage' period, predicting churn could be useless since by that time the customer would have already switched to another operator.

APPROACH

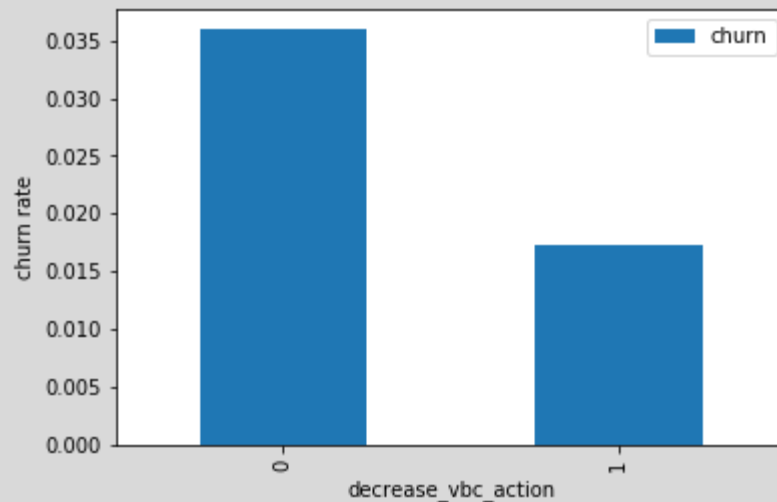

- Importing the Dataset
- Inspecting the DataFrame
- Missing Value Treatment
- Data Preparation
- Univariate Analysis
- Outlier Treatment
- Creating Dummy Variables
- Train - Test Split
- Feature Scaling
- Model Building
- Feature Selection Using RFE
- Plotting the ROC Curve
- Finding Optimal Cut-Off Points
- Precision and Recall
- Making Predictions on the Test Set

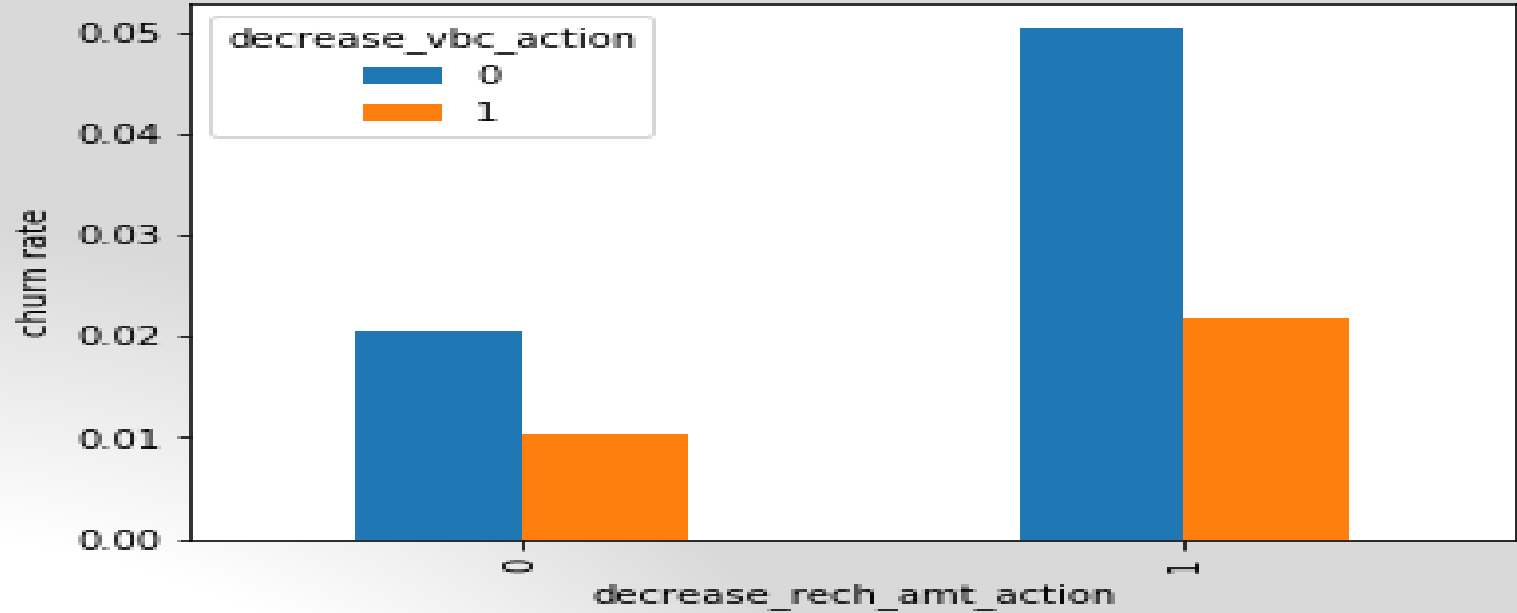

The Top factors that influence the telecom churn.

Model Evaluation(Train)

Model Evaluation(Test)

Conclusion

Recommendations:

1. Target the customers, whose minutes of usage of the incoming local calls and outgoing ISD calls are less in the action phase (mostly in the month of August).
2. Target the customers, whose outgoing others charge in July and incoming others on August are less.
3. Also, the customers having value based cost in the action phase increased are more likely to churn than the other customers. Hence, these customers may be a good target to provide offer.
4. Customers, whose monthly 3G recharge in August is more, are likely to be churned.
5. Customers having decreasing STD incoming minutes of usage for operators T to fixed lines of T for the month of August are more likely to churn.
6. Customers decreasing monthly 2g usage for August are most probable to churn.
7. Customers having decreasing incoming minutes of usage for operators T to fixed lines of T for August are more likely to churn.
8. roam_og_mou_8 variables have positive coefficients (0.7135). That means for the customers, whose roaming outgoing minutes of usage is increasing are more likely to churn.

Thank You
